

## TSS-002 - Circuit Rock

The Circuit Rock is a B66 TSS-class SYNTHETIC PICTURE. Circuit Rocks are commonly found in the Patterned Desert. They are the remnants of organisms long gone. Once the ferric chloride sea covered this area, and printed circuits thrived. Due to the geological activity, the sea receded, leaving only their harder structures. However, some say that if even a few bits were recovered, one could recreate these ancient electro-microbial mats.
